

LeafFlow: Solving the Tea Estate Crisis

Video App Flow & Problem-Solution Mapping

This document breaks down the video flow of the LeafFlow app, mapping each scene and UI interaction directly to the critical operational problems it solves for a modern tea estate.

1. The Planning Phase

The Problem (The Chaos):

Managers spend hours in the morning writing out targets on whiteboards or paper slips. Once supervisors leave for the fields, the manager has zero visibility into whether those tasks were actually started. "Are they plucking the right clone type? Are they hitting the target?"

The App Flow (Video Scene):

The video shows the **Manager Dashboard**. The Manager taps "Assign Task" (Kamjari), selects a specific Dafa and Section, sets a target weight (e.g., 3,500 kg), and assigns it.

The Solution:

Total digital deployment. Targets are instantly pushed to the Supervisor's device. The Manager can see the exact status of every active plan in real-time from the "Active Plans" grid. No more guessing.

2. In-Field Attendance (The Morning Check-in)

The Problem (The Leakage):

Tea estates bleed money through "ghost workers" and buddy punching. Paper attendance sheets are easily manipulated, get ruined in the rain, and take days to reach the payroll office. Furthermore, 90% of tea fields have zero cellular network.

The App Flow (Video Scene):

The video cuts to the field. The Supervisor opens the **My Kamjari** screen and accesses the **Attendance Roster**. Despite having "No Service," they quickly tap green checkmarks next to the workers who are physically present.

The Solution:

LeafFlow's **Offline-First Architecture**. Using local SQLite databases, the app instantly saves attendance

without needing the internet. It guarantees that only workers who were physically logged in the field by a supervisor can be paid later.

3. The Weighing Station (Mid-Day & Evening)

The Problem (The Fraud & Errors):

At the weighing station, clerks write down weights on paper slips. This leads to illegible handwriting, manual transcription errors, and sometimes outright weighment fraud (logging weight for a worker who isn't even there).

The App Flow (Video Scene):

The video shows the **Clerk Scanner / Weighing Screen**. The clerk searches for a worker. The system automatically blocks any worker who wasn't marked "Present" in the morning. The clerk taps the large, high-contrast keypad to enter the exact weight from the scale.

The Solution:

Strict **Data Integrity and Row Level Security**. The UI prevents impossible entries. By validating against the morning attendance, LeafFlow completely eliminates the possibility of ghost weights. Every kilogram is tied securely to a verified worker.

4. Task Finalization & Reconciliation (End of Day)

The Problem (The Blind Spot):

In a traditional estate, it takes 2 to 3 days for paper records to travel from the field, to the clerk, to the data entry operator, to the manager's desk. The Manager doesn't know today's actual harvest yield until Thursday.

The App Flow (Video Scene):

The video uses a split screen. On one side, the Supervisor reviews the **Worker Submissions** and taps "Finalize Task." On the other side, the **Manager Dashboard** instantly updates—the "Active Plans" counter drops, and the "Harvest Today" metric ticks up perfectly.

The Solution:

Zero-Latency Operational Visibility. Through real-time cloud synchronization, the absolute moment the work is done in the field, the ledger is closed in the office. Payroll reports and harvest yields are instantly generated, giving the estate ownership complete financial control.
